Bale Yield Planner Worksheet

Printable field reference

Fill this in at the calculator online, or work it by hand with the formulas below. Loads are weight-based only — verify deck space and legal axle limits separately.

1. Your inputs

Acres _____

Yield input (circle one): _____

☐ Tons/acre ☐ Bales/acre

Yield value _____

Truck/trailer payload, optional (lb) _____

Bale type (circle one): _____

☐ Round ☐ Square/rectangular

Known bale weight, optional (lb) _____

Density (lb/ft³) _____

Round: diameter × width (in) _____

Square: L × W × H (in) _____

2. Formulas

```
Round bale volume (ft³) = π × (D/2)² × W  Square bale volume = L × W × H
Bale weight (lb) = volume × density (if no known weight)
Total bales = acres × bales/acre, or (acres × tons/acre × 2000) ÷ bale weight
Total tons = acres × tons/acre, or (total bales × bale weight) ÷ 2000
Loads = ceil(total weight ÷ payload)
```

3. Worked example

35 acres at 3.5 bales/acre; known bale weight 900 lb; payload 14,000 lb:
Total bales = 35×3.5 = **123 bales** · Total weight = 123×900 = **110,700 lb**
Total tons = 110,700÷2,000 = **55.4 tons** · Loads ≈ 110,700÷14,000 = 7.91 → **8 loads**

4. Your numbers

Estimated bale weight (lb)	volume × density	_____
Total bales	see formulas	_____
Total tonnage	bales × weight ÷ 2000	_____
Loads by payload (est)	weight ÷ payload	_____

Notes
